

UML

Experiment-3

Aim To understand the concept of UML (Unified modelling language) & draw use case diagrams with their relationships for software development.

Theory :-

UML - Unified modeling language is a standard modeling language used to visualize, specify, construct & document the structure & behaviour of a software system.

It provides both static (structural) & dynamic (behaviour) views of the system.

UML is widely used in software development for designing & analyzing system before actual implementation.

* Use case Diagram:- A use case diagram is used to represent the functional requirements of a system. It shows actors (Users or external system) & use cases (services or functional provided by the system).

Representation Elements:-

(1) Actor:- External entity interaction with the system, shown as a stick figure.

Use Case

use case generalization.

(2) Use Case - A system function, represented by an oval. Perform some task for Actor.

(3) Association - A solid line between actor & use case.

(4) Include - Shows mandatory sense of another use case. (to avoid repetition)
Notation => <<include>>

Example "Login" use case may include "validate user".

(5) Extend - Represent optional / conditional behaviour
Notation => <<extend>>

Example - "Place order" may extend "Apply discount".

(6) Generalization - Shows inheritance between actors or use cases

- Represented by a solid line with a hollow arrowhead pointing to the parent.
- Example -

"Registered user" & "Guest user" can both generate the actor "customer".

LMS Library management system

Expt. No. _____

Date _____

Page No. 18

⇒ It gives how a child can specialize behaviour characteristics from parent.

Process

- (1) Identify actors (User, systems interacting with software)
- (2) Identify use cases (functional requirements)
- (3) Draw system boundary (Rectangle)
- (4) Place actor outside boundary & connect them to the use cases.
- (5) Add relationships (association, include, extend, generalization) where required.

Result:- The concept of UML & use case diagrams were studied. The diagram was ~~same~~ successfully drawn showing actors, use cases & relationships (association, include, extend, generalizations)
